IN THE CLAIMS:

Claims 1, 12, 21, 22, and 23 are amended herein. All pending claims and their present status are listed below.

- 1 1. (currently amended) A probe apparatus for application monitoring, comprising:
- 2 (a) a data collection module for collecting data from a network segment;
- 3 (b) a flow processor coupled to the data collection module for classifying the
- 4 collected data into a plurality of flows;
- 5 (c) a capture system coupled to the flow processor for filtering and buffering the
- 6 collected data <u>based on the collected data and the flow corresponding to the collected</u>
- 7 <u>data</u>; and
- 8 (d) a main processor for processing the filtered data based on the collected data and
- 9 the flow corresponding to the filtered data.
- 1 2. (Original) The probe apparatus as recited in claim 1, wherein the data collection
- 2 module prepends the data with descriptor information, wherein the descriptor information
- 3 is used by the capture system to filter the collected data.
- 1 3. (Original) The probe apparatus as recited in claim 1, wherein the capture system
- 2 includes a capture buffer and a focus buffer, wherein the capture system filters the
- 3 collected data stored in the capture buffer, wherein the filtered data is sent to the focus
- 4 buffer.
- 1 4. (Original) The probe apparatus as recited in claim 3, wherein the capture system
- 2 captures the collected data in the capture buffer in at least one of a fill and stop mode, a
- wrap mode, a priority queuing mode, and a non-priority queuing mode.
- 1 5. (Original) The probe apparatus as recited in claim 4, wherein in priority queuing
- 2 mode the capture buffer is segmented into priority and non-priority queues, wherein the

- 3 buffer space for each queue varies dynamically based on the arrival of data that meets
- 4 priority criteria.
- 1 6. (Original) The probe apparatus as recited in claim 5, wherein buffers are
- 2 reallocated to the priority queue from the non-priority queue as the number of priority
- 3 flows increases.
- 7. (Original) The probe apparatus as recited in claim 5, wherein buffers are
- 2 reallocated to the non-priority queue from the priority queue as the number of priority
- 3 flows decreases.
- 1 8. (Original) The probe apparatus as recited in claim 5, wherein the capture system
- 2 selectively discards flows from the priority queue based on predetermined criteria.
- 1 9. (Original) The probe apparatus as recited in claim 1, wherein the main processor
- 2 identifies a flow as being important, wherein the flow processor uses the identification as
- 3 criteria for forwarding additional data from the identified flow to the main processor.
- 1 10. (Original) The probe apparatus as recited in claim 1, wherein at least a portion of
- the probe apparatus is implemented on a Field Programmable Gate Array (FPGA).
- 1 11. (Original) The probe apparatus as recited in claim 10, wherein the portion of the
- 2 probe apparatus implemented on the FPGA includes dedicated FPGA engines for capture
- 3 and filtering of the data.
- 1 12. (Currently amended) A method for application monitoring, comprising:
- 2 (a) collecting data from a network segment;
- 3 (b) classifying the collected data into a plurality of flows;

- 4 (c) filtering and buffering the collected data based on the collected data and the flow
- 5 corresponding to the collected data; and
- 6 (d) processing the filtered data <u>based on the collected data and the flow</u>
- 7 corresponding to the collected data.
- 1 13. (Original) The method as recited in claim 12, further comprising prepending the data
- 2 with descriptor information, wherein the descriptor information is used to filter the collected
- 3 data.
- 1 14. (Original) The method as recited in claim 12, further comprising storing the collected
- data in a capture buffer, filtering the collected data stored in the capture buffer, and sending
- 3 the filtered data to a focus buffer.
- 1 15. (Original) The method as recited in claim 14, further comprising capturing the
- 2 collected data in the capture buffer in at least one of a fill and stop mode, a wrap mode, a
- 3 priority queuing mode, and a non-priority queuing mode.
- 1 16. (Original) The method as recited in claim 15, further comprising segmenting the
- 2 capture buffer into priority and non-priority queues in priority queuing mode, wherein the
- buffer space for each queue varies dynamically based on the arrival of data that meets
- 4 priority criteria.
- 1 17. (Original) The method as recited in claim 16, further comprising reallocating buffers
- 2 to the priority queue from the non-priority queue as the number of priority flows increases.
- 1 18. (Original) The method as recited in claim 16, further comprising reallocating buffers
- 2 to the non-priority queue from the priority queue as the number of priority flows decreases.
- 1 19. (Original) The method as recited in claim 16, wherein the capture system selectively
- discards flows from the priority queue based on predetermined criteria.

- 1 20. (Original) The method as recited in claim 12, further comprising identifying a flow
- of data as being important, and using the identification as criteria for forwarding additional
- 3 data from the identified flow for processing.
- 1 21. (currently amended) A computer program product for application monitoring,
- 2 comprising:
- 3 (a) computer code for collecting data from a network segment;
- 4 (b) computer code for classifying the collected data into a plurality of flows;
- 5 (c) computer code for filtering and buffering the collected data <u>based on the collected</u>
- 6 data and the flow corresponding to the collected data; and
- 7 (d) computer code for processing the filtered data <u>based on the collected data and the</u>
- 8 flow corresponding to the collected data.
- 1 22. (Currently amended) A probe apparatus for application monitoring, comprising:
- 2 (a) a data collection module for collecting data from a network segment;
- 3 (b) a flow processor coupled to the data collection module for classifying the collected
- 4 data into a plurality of flows;
- 5 (c) a capture system coupled to the flow processor for filtering and buffering the
- 6 collected data based on the collected data and the flow corresponding to the collected data,
- wherein the capture system includes a capture buffer and a focus buffer, wherein in priority
- 8 queuing mode the capture buffer is segmented into priority and non-priority queues, wherein
- 9 the buffer space for each queue varies dynamically based on the arrival of data that meets
- 10 priority criteria; and
- 11 (d) a main processor for processing the filtered data based on the collected data and the
- 12 flow corresponding to the collected data.

- 23. (Currently amended) A probe apparatus for application monitoring, comprising:
- (a) a data collection module for collecting data from a network segment;
- (b) a flow processor coupled to the data collection module for classifying the collected data into a plurality of flows;
- (c) a capture system coupled to the flow processor for filtering and buffering the collected data <u>based on the collected data and the flow corresponding to the collected data</u>; and
- (d) a main processor for processing the filtered data <u>based on the collected data and the</u> flow corresponding to the collected <u>data</u>;
- (e) wherein the data collection module prepends the data with descriptor information, wherein the descriptor information is used by the capture system to filter the collected data;
- (f) wherein the capture system includes a capture buffer and a focus buffer, wherein the capture system filters the collected data stored in the capture buffer, wherein the filtered data is sent to the focus buffer;
- (g) wherein the capture system captures the collected data in the capture buffer in at least one of a fill and stop mode, a wrap mode, a priority queuing mode, and a non-priority queuing mode;
- (h) wherein in priority queuing mode the capture buffer is segmented into priority and non-priority queues, wherein the buffer space for each queue varies dynamically based on the arrival of data that meets priority criteria;
- (i) wherein buffers are reallocated to the priority queue from the non-priority queue as the number of priority flows increases;
- (j) wherein buffers are reallocated to the non-priority queue from the priority queue as the number of priority flows decreases;
- (k) wherein the capture system selectively discards flows from the priority queue based on predetermined criteria including at least one of an amount of priority data exceeding a processing capability of the system, user specifications, and the flow matching a randomly selected identifier;

- (1) wherein the main processor identifies a flow as being important, wherein the flow processor uses the identification as criteria for forwarding additional data from the identified flow to the main processor;
- (m) wherein at least a portion of the probe apparatus is implemented on a Field Programmable Gate Array (FPGA);
- (n) wherein the portion of the probe apparatus implemented on the FPGA includes dedicated FPGA engines for capture and filtering of the data.
